

## Abstract

The present invention provides a pharmaceutical preparation to be dispersed before administration which has an adequate viscosity and a suitable flowability even when dispersed in a small amount of water and can be easily administered through an NG tube is provided. Specifically, the pharmaceutical preparation to be dispersed before administration contains active granules containing a pharmaceutically active substance having an average particle diameter of 5 mm or less and a thickening agent, and can be administered through an NG tube by dispersing in water before administration.
